Introduction

The Provincial Health Logistics Management Center of Lumbini Province held a workshop On Baisakh 16th-17th, 2083 (Apr 29-30, 2026) to forecast and quantify basic health medicines for the fiscal year 2083/84 (2026/27). As country went through the federal structure, the quantification and forecast exercise is carried out by the provincial government. This quantification exercise is crucial to identify the needs and funding requirements for health commodities. It provides an excellent platform for MoH, PHD, PHLMC, HOs, Hospitals and EDPs to discuss budget allocation and to identify shortfalls to facilitate their procurement plan on time. It also provides an opportunity for interactions between the stakeholders (Government and EDPs) to improve supply chain management and improve health commodity security in Lumbini Province. It also serves as the main basis for PHLMC to plan their health commodity budgets in their annual work plans and it sets the basis for health commodity procurement schedule and supply planing. The decisions made at these workshops are based on a consensus among the stakeholders which has improved the public-sector procurement system and the government's commitment for the delivery of adequate health commodities to strengthen basic health care services.

The workshop was chaired by Dr. Rajendra Kumar Giri, Director, PHLMC, Lumbini Province. He welcomed all participants and briefed a presentation on the history of the quantification exercise and provided the overview of quantification and its processes. He also detailed out the objective of the workshop and explain the method of quantifications to be applied.

Objective of the Workshop

- To forecast and quantify health commodities for SDPs of all Twelve districts and all hospitals of Lumbini Province.
- To identify budget gaps and budget allocations to procure the commodities needed by the provincial government for next fiscal year.

Mr. Roshan Lal Chaudhary, Director, Health Directorate, Lumbini Province welcomed all the participants for the quantification exercise. He mentioned that the using the different methods of forecasting and reviewing the stock status will help in uninterrupted supply of the commodities in the health facilities. He added that the quantification exercise is very important to perform fiscal management and proper use of procurement budget. He also added that all the participants should engage in active participation and must be accountable for the quantification data.

Basis of Forecasting and Quantification

The quantification and forecasting exercise used historical consumption data, morbidity, demographic data, and allocation to project and predict future need. The forecasts is based on data from the health management information system (HMIS), the electronic logistics management information system (e-LMIS), Public Assests Management System (PAMS V2), demographic health surveys, census data, and policy documents.

The forecasts were based on the following criteria and assumptions:

- **Consumption data:** Consumption data provides the actual number of commodities consumed within a specified period especially in mature stable programs that have had an uninterrupted supply of commodities. The last three fiscal year (2079/80, 2080/81 & 2081/82) consumption of service delivery points with reporting adjustment were considered.
- **Demographic data:** Data on population growth and trends, geographical distribution, age, gender is used to identify how much of the total population was affected by specific diseases. This data will also be used to estimate the change on population growth over time to forecast health commodity needs.
- **Morbidity data:** The analysis of demographic data and morbidity data provided the best estimate for health commodity forecasts. This estimates the need for specific medicines based on the expected number of attendances, incidence and prevalence of diseases or health conditions in the population. However, the data on patient attendance was incomplete, and the percentage of prescribers following Standard Treatment Guideline is difficult to obtain, and only a limited number of health problems were addressed.
- Some products such as lifesaving were forecasted based on allocation to health facilities.
- The forecasting team decided the best estimate to use.

Basis of determining required quantities

The stock status report was developed by each district for each product following criteria and assumptions need to be accounted for when determining the required quantities to procure:

Current stock levels – The current province, HOs and LLGs stocks of drugs and medicines were taken into considerations while finalizing the procurement quantities. The closing balance of each level was physically verified, also with PAMS V2 software for reliable data. The PAMS data was applicable if all the SDPs had fully utilized and is operational in the health facility.

Commodities in the pipeline – The pipeline is the entire chain of storage facilities and transportation links through which supplies move from manufacturer to customer. The quantification exercise considered the quantity of commodities in the pipeline and shipment schedules.

Maximum and minimum levels – An inventory control method was used that required each health facility to set maximum and minimum desired stock levels for each item to ensure that quantities fell within the established range. This range depends on available storage facility, transportation facility, and weather condition, and geographical accessibility. The quantification is based on making stocks up to the desired maximum at the provincial level and LLGs, which also includes procurement lead time and safety stocks.

Technical sessions

Workshop Proceedings

With permission from Mr. Rajendra Kumar Giri, the chairperson of the program, the technical session was initiated by Mr. Mahesh Dotel from Sunaulo Pariwar Nepal along with team members from PHLMC with brief discussion on modality to be followed to estimate the requirements for province, district and local level.

Modality followed to estimate the require quantity for Province

- For product selection total 182 product were selected (36 items to be procured by Federal Government, 61 items to be procured by PHLMC and 85 items to be procured by LLG).
- PHLMC team and facilitator supported participants from HO and Hospitals to build projections for mid July 2026 to mid-July 2027 (FY 2083/84) while also reviewing and adjusting eLMIS reporting of last three FY.

- Forecasted the quantity using different forecasting method such as consumption, morbidity, population/demographic and allocation to health facilities.
- A comparison among the consumption data of health facilities as well as morbidity data classified based on the outpatients clinical diagnosis.
- Determined the quantity required to procure to reach the maximum level that is 15 months for (12 months regular and 3 months buffer) for PHLMC.
- The stock on hand of province, HOs and Hospitals were considered to estimate the quantity require to procure.
- Compilations of all Hospital and all HO for PHLMC considering the stock balance of health logistics management center, HO and LLGs for the require procurement quantity.

Closing remarks

Mr. Bhuwan Kunwar, Public Health Administrator thanked to the Province Health Logistics Management Center for organizing the workshop. He appreciated the faciliators for providing technical assistance and congratulated the team for their hard work; also highlighted that this was a critical step to ensure an uninterrupted supply of drugs and other commodities to health facilities and the workshop is effective to manage procurement, reduce expiry and manage stock status.

Estimated Quantity

A total 182 product were selected in which 36 items to be procured by Federal Government, 61 items to be procured by PHLMC and 85 items to be procured by LLG. The total requirement of budget estimated for 12 health offices and hospital was **1,46,52,68,246/-/-** for basic medicines to be procured in province in next FY 2083/84.

Issues/challenges

- Forecasting and Quantification has been continuously organized in province for last three years though the data quality from Hospital and Health offices are poor.

- The vacant positions of storekeepers/focal person in the districts have created a gap in the participation of expected human resources in workshops, which has impacted the delivery of results and ultimately affected procurement at each level.
- There is a lack of essential data such as morbidity and demographic information, closing balance, pipeline details and unit cost of medicines.
- Weak coordination between program teams and procurement units in district and local levels.
- Incompetent human resources to use PAMS V2 and extracting data for forecasting as it is not fully operational at SDP levels.

Recommendations

- Health workers need awareness about the importance of forecasting and Quantification to strengthen supply chain and generate more evidence based forecasting.
- Need to operationalize PAMS V2 at SDP level and add features like report generation is necessary.
- Build the capacity of LLGs in conducting quantification exercises, as they are responsible for procuring basic health service medicines.
- Annual forecasting of Vaccines & Ayurved Medicines is necessary to reduce shortage and for timely procurement.
- Provinces and LLGs should conduct annual quantification exercises prior to developing procurement plans and allocate specific budgets for these activities.
- Coordination meeting with Management Division, MoH and PHLMC for procurement plans and avoid duplication during medicine procurement.
- The Ministry of Health needs to update the medicine list and procurement levels regularly.
